High	Cloud Metadata Potentially Exposed
Description	<p>The Cloud Metadata Attack attempts to abuse a misconfigured NGINX server in order to access the instance metadata maintained by cloud service providers such as AWS, GCP and Azure.</p> <p>All of these providers provide metadata via an internal unrouteable IP address '169.254.169.254' - this can be exposed by incorrectly configured NGINX servers and accessed by using this IP address in the Host header field.</p>

Attack	169.154.169.254
Evidence	
Instances	1
Solution	Do not trust any user data in NGINX configs. In this case it is probably the use of the \$host variable which is set from the 'Host' header and can be controlled by an attacker.

Solution	<p>Phase: Architecture and Design</p> <p>Use a vetted library or framework that does not allow this weakness to occur or provides construction guidelines.</p> <p>For example, use anti-CSRF packages such as the OWASP CSRFGuard.</p> <p>Phase: Implementation</p> <p>Ensure that your application is free of cross-site scripting issues, because most CSRF defenses are based on the assumption that the application is free of XSS.</p> <p>Phase: Architecture and Design</p> <p>Generate a unique nonce for each form, place the nonce into the form, and verify the nonce upon submission. This prevents CSRF attacks that rely on predictability (CWE-330).</p> <p>Note that this can be bypassed using XSS.</p> <p>Identify especially dangerous operations. When the user performs a dangerous operation, send a confirmation message asking the user if they really intended to perform that operation.</p> <p>Note that this can be bypassed using XSS.</p> <p>Use the ESAPI Session Management control.</p> <p>This control includes a component for CSRF.</p> <p>Do not use the GET method for any request that triggers a state change.</p> <p>Phase: Implementation</p> <p>Check the HTTP Referer header to see if the request originated from an expected page. This controls the browser's behavior when it receives a response with a different Referer header than the one it sent. Some browsers may have disabled sending the Referer for privacy reasons.</p>

Medium	CSP: Wildcard Directive
Description	Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks. Including (but not limited to) Cross Site Scripting (XSS), and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware. CSP provides a set of standard HTTP headers that allow website owners to declare approved sources of content that browsers should be allowed to load on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embeddable objects such as Java applets, ActiveX, audio and video files.

Solution	Ensure that your web server, application server, load balancer, etc. is configured to set the Content-Security-Policy header. Most modern browsers support: "Content-Security-Policy" for Chrome 25+, Firefox 23+ and Safari 7+, "X-Content-Security-Policy" for Internet Explorer 11+, and "X-WebKit-CSP" for Chrome 14+ and Safari 6+.

Solution	<p>Modern Web browsers support the Content-Security-Policy and X-Frame-Options HTTP headers. Ensure one of them is set on all web pages returned by your site/app.</p> <p>If you expect the page to be framed only by pages on your server (e.g. it's part of a FRAMESET) then you'll want to use SAMEORIGIN, otherwise if you never expect the page to be framed, you should use DENY. Alternatively consider implementing Content Security Policy's "frame-ancestors" directive.</p>

Solution	Review the source code of this page. Implement custom error pages. Consider implementing a mechanism to provide a unique error reference/identifier to the client (browser) while logging the details on the server side and not exposing them to the user.

Low	CSP: Notices
Description	Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks. Including (but not limited to) Cross Site Scripting (XSS), and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware. CSP provides a set of standard HTTP headers that allow website owners to declare approved sources of content that browsers should be allowed to load on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embeddable objects such as Java applets, ActiveX, audio and video files.

Low	X-Content-Type-Options Header Missing
Description	The Anti-MIME-Sniffing header X-Content-Type-Options was not set to 'nosniff'. This allows older MIME-sniffing on the response body, potentially causing the response body to be interpreted as the wrong content type. Current (early 2014) and legacy versions of Firefox will use the declared content type.

Informational Charset Mismatch

Description	<p>This check identifies responses where the HTTP Content-Type header declares a charset different from the charset defined by the body of the HTML or XML. When there's a charset mismatch between the HTTP header and content body Web browsers can be forced into an undesirable content-sniffing mode to determine the content's correct character set.</p> <p>An attacker could manipulate content on the page to be interpreted in an encoding of their choice. For example, if an attacker can control content at the beginning of the page, they could inject script using UTF-7 encoded text and manipulate some browsers into interpreting that text.</p>

Solution	Ensure that your web server, application server, load balancer, etc. is configured to set the Content-Security-Policy header. The Content-Security-Policy header is supported by most modern browsers. For example, you can use the following policy: "Content-Security-Policy" for Chrome 25+, Firefox 23+ and Safari 7+, "X-Content-Security-Policy" for Internet Explorer 11 and "X-WebKit-CSP" for Chrome 14+ and Safari 6+.

Informational	Loosely Scoped Cookie
Description	Cookies can be scoped by domain or path. This check is only concerned with domain scope. The cookie's domain can access it. For example, a cookie can be scoped strictly to a subdomain e.g. www.nottrusted.com. In the latter case, any subdomain of nottrusted.com can access the cookie. Look at cookies from google.com and live.com. Cookies set from a subdomain like app.foo.bar are transmitted only to the parent-level domain or to any subdomain of the parent.
